PC>
```

QUESTION 2

To ensure dynamic routing, I used rip & ospf. It also provided shortest network path which is extendable if dynamic.

QUESTION 3

To provide encryption, used ssh. It also ensured security by providing a login & password.

QUESTION 7

(a) $175.38.67.0/16$ has 65534 hosts.
And subnet needs 0 host.

(b) $199.38.67.0/24$ has ~~254~~ 254 host.
The subnet needs 67 hosts.

QUESTION 8

ACL stands for Access control list. It is used to permit or deny access of a host from sending to another host. It is used to block or filter incoming or outgoing traffic.

Few of the rules are:

- Should have a permit statement in our access list.
- For PC 4, we should restrict connection.

QUESTION 90

① for 30 subnets $\rightarrow 2^5 = 32$

adding 8 in last octet, 30 subnets are achieved

$$203.10.93.1 - 203.10.93.254$$

$\therefore 203.10.93.30$ is a valid ip as host.

② A simple static router can be used. It provides simplicity & ensure proper working. ~~along~~ Routing protocols are needed to send packets quickly to their destination without any loss by shortest path & also ensures that next hop is correct.

③ RIP with ospf is best technique as it's dynamic. It can easily be expanded as networks grow. It is better than default & static routing. It uses the concept of dijkstra's algo & considers bandwidth while routing.

④ check if router & switch are turned on. If necessary, so reset. Ensure that correct interface is connected with correct configurations.

⑤ Subnet = 25

Broadcast Id - 172.16.10.12/25

Network address - 172.16.10.0/25

valid host range - 172.16.10.1 - 172.16.127.126.

⑥ It occurs in the ~~network~~ to network layer.

⑦ Application layer is highest OSI layer because ftp is implemented on it.

⑧ The most suitable protocol is BGP (border gateway protocol) as it makes communication independent b/w networks & provides shortest routes.

⑩ The route is configured incorrectly.
